

BTS 2025 - 2026

Supervision réseau et système avec Nagios Core sous Ubuntu Server

Anis Guechetouli

The Nagios logo is displayed in a large, bold, black serif font. The letter 'N' is underlined. A registered trademark symbol (®) is located at the top right of the word. Several thin, dark blue curved lines are positioned to the left of the logo, extending from the bottom left towards the middle of the word.

Nagios®

Introduction

La supervision est un pilier fondamental de l'administration système et réseau, permettant de garantir la haute disponibilité des services informatiques. Dans le cadre de cette production, nous mettons en œuvre **Nagios Core**, une solution logicielle libre de référence sous licence GPL. Nagios permet de surveiller en temps réel l'état des hôtes (serveurs, commutateurs) et des services (HTTP, SSH, SMTP), en alertant l'administrateur en cas de dysfonctionnement via une interface web intuitive ou des notifications par mail. L'architecture de Nagios repose sur l'utilisation de "plugins", de petits programmes modulaires qui interrogent les ressources du système. Ce projet se déroule sur un environnement **Ubuntu 20.04 LTS**, une version bénéficiant d'un support à long terme, garantissant ainsi la stabilité et la sécurité nécessaire à un outil de monitoring critique. L'objectif est de centraliser la visibilité du système d'information pour réagir proactivement aux incidents.

1. Préparation de l'environnement réseau

Avant l'installation, nous configurons l'identité réseau du serveur pour assurer sa joignabilité.

- **Configuration du clavier** : `dpkg-reconfigure keyboard-configuration` pour passer en AZERTY.
- **Installation de l'outil réseau** : `apt install ifupdown -y`.

```
GNU nano 4.8 /etc/netplan/00-installer-config.yaml
# This is the network config written by 'subiquity'

root@Nagios:~#
```

- **Nom d'hôte et DNS** : Modification de `/etc/hostname` (nom : `nagios`) et du fichier `/etc/hosts` pour lier l'IP `172.20.1.9` au FQDN `nagios.m2l.local`.
- **Vérification** : Commande `ip a` pour confirmer l'adresse et `ping google.fr` pour valider la connectivité internet.

```
user@Nagios: ~
GNU nano 4.8
127.0.0.1 nagios.m2l.local    nagios    localhost
172.20.1.9 nagios.m2l.local    Nagios
```

2. Installation des dépendances et compilation

Nagios Core est compilé à partir des sources pour une installation optimisée.

- **Téléchargement et Extraction** : Récupération de l'archive Nagios 4.4.8 dans /tmp et décompression avec tar xvfz.

```
root@nagios:~# cd /tmp

4. Sécurisation et Premier Accès

- **Pare-feu** : Autorisation du port 80 via `ufw allow Apache`.

- **Création du compte administrateur :** `htpasswd -c /usr/local/nagios/etc/htpasswd.users nagiosadmin` (Ce compte sera utilisé pour se connecter à l'interface web).

```
root@Nagios:/tmp/nagioscore-nagios-4.4.8#
root@Nagios:/tmp/nagioscore-nagios-4.4.8# htpasswd -c /usr/local/nagios/etc/htpasswd.users nagiosadmin
New password:
Re-type new password:
Adding password for user nagiosadmin
root@Nagios:/tmp/nagioscore-nagios-4.4.8# systemctl restart apache2.service
root@Nagios:/tmp/nagioscore-nagios-4.4.8# systemctl status apache2.service
● apache2.service - The Apache HTTP Server

```

- **Test de connexion :** Depuis un navigateur sur le réseau, on accède au dashboard de Nagios, via l'adresse : `http://172.20.1.9/nagios`.

On met comme utilisateur nagiosadmin et comme mot de passe, celui défini lors de la configuration précédente, grâce à ça, on accède à l'interface d'accueil :

5. Installation des Plugins Nagios

Les plugins sont les "yeux" de Nagios.

- **Installation des bibliothèques :** `apt install -y libmbedtls-dev libssl-dev bc gawk dc build-essential snmp libnet-snmp-perl gettext`.

```
Sélection root@Nagios: ~
root@Nagios:~/tmp/nagioscore-nagios-4.4.8# apt install -y libmbedtls-dev libssl-dev bc gawk dc build-essential snmp lib
net-snmp-perl gettext
Lecture des listes de paquets... Fait
Construction de l'arbre des dépendances... Fait
Lecture des informations d'état... Fait
libssl-dev est déjà la version la plus récente (1.0.13-0ubuntu3.7).
bc est déjà la version la plus récente (1.07.1-3ubuntu4).
bc passé en « installé manuellement ».
dc est déjà la version la plus récente (1.07.1-3ubuntu4).
dc passé en « installé manuellement ».
Les paquets supplémentaires suivants seront installés :
  dpkg-dev fakeroot g++ g++-13 g++-13-x86-64-linux-gnu g++-x86-64-linux-gnu libalgorithm-diff-perl
  libalgorithm-diff-xs-perl libalgorithm-merge-perl libdpkg-perl libfakeroot libfile-fcntllock-perl libmbedtls4 libsigsegv2
  libstdc++-13-dev lto-disabled-list

```

6. Configuration de la Supervision (Hôtes et Services)

Afin de superviser les machines Windows, on décommente ces trois lignes dans le fichier :
`nano -c /usr/local/nagios/etc/nagios.cfg`

```
Selection root@Nagios: ~
GNU nano 7.2 /usr/local/nagios/etc/nagios.cfg
#
# NAGIOS.CFG - Sample Main Config File for Nagios 4.4.0
#
# Read the documentation for more information on this configuration
# file. I've provided some comments here, but things may not be so
# clear without further explanation.
#
#####
# LOG FILE
# This is the main log file where service and host events are logged
# for historical purposes. This should be the first option specified
# in the config file!!!
log_file=/usr/local/nagios/var/nagios.log
#
# OBJECT CONFIGURATION FILE(S)
# These are the object configuration files in which you define hosts,
# host groups, contacts, contact groups, services, etc.
# You can split your object definitions across several config files
# if you wish (as shown below), or keep them all in a single config file.
#
# You can specify individual object config files as shown below:
cfg_file=/usr/local/nagios/etc/objects/commands.cfg
cfg_file=/usr/local/nagios/etc/objects/contacts.cfg
cfg_file=/usr/local/nagios/etc/objects/timeperiods.cfg
cfg_file=/usr/local/nagios/etc/objects/templates.cfg
```

On édite `nagios.cfg` pour activer la surveillance des équipements distants.

Supervision Windows : Dans `/usr/local/nagios/etc/objects/windows.cfg`, on

déclare nos serveurs : Bash

```
define host { use :
windows-server
host_name : Hemes
alias : AD-DS
address : 172.20.1.2
}
```

puis à chaque “define service” on change le define host en Hermes

```
# Change the host_name, alias, and address to fit your situation

define host {

    use                windows-server        ; Inherit default values from a template
    host_name          Hermes                ; The name we're giving to this host
    alias              AD-US                 ; A longer name associated with the host
    address             172.20.1.2           ; IP address of the host
}

#####
#
# HOST GROUP DEFINITIONS
#
#####

# Define a hostgroup for Windows machines
# All hosts that use the windows-server template will automatically be a member of this group

define hostgroup {

    hostgroup_name     windows-servers      ; The name of the hostgroup
    alias              Windows Servers      ; Long name of the group
}

```

- **Supervision Linux** : Dans `localhost.cfg`, on ajoute les serveurs Linux comme *Zimbra* (172.20.0.15). On pense à modifier le champ `host_name` dans les définitions de services pour inclure ces nouveaux noms.

```
#####
#
# HOST DEFINITION
#
#####

# Define a host for the local machine

define host {

    use                linux-server          ; Name of host template to use
                                           ; This host definition will inherit all variables that are defined
                                           ; in (or inherited by) the linux-server host template definition.

    host_name          Nagios
    alias              Serveur de Supervision
    address             172.20.1.9
}

define host(
    use                linux-server
    host_name          Zimbra
    alias              Serveur de messagerie
    address             172.20.4.2
)

```

7. Notifications par Email

- **Relais Mail** : Installation de `ssmtp` et configuration de `/etc/ssmtp/ssmtp.conf` avec `mailhub=mail.stadiumcompany.com`.

- **Contact** : Dans `objects/contacts.cfg`, on lie l'utilisateur `nagiosadmin` à l'adresse `admin@stadiumcompany.com`.

```
GNU nano 7.2 /etc/ssmtp/revaliases *
# sSMTP aliases
#
# Format:      local_account:outgoing_address:mailhub
#
# Example: root:your_login@your.domain:mailhub.your.domain[:port]
# where [:port] is an optional port number that defaults to 25.
root:adminNagios@stadiumcompany.com
```

- **Commandes** : Modification de `commands.cfg` pour s'assurer que le chemin vers l'exécutable mail est correct (`/usr/bin/mail`).

```
# CONTACTS
#
# =====
# Just one contact defined by default - the Nagios admin (that's you)
# This contact definition inherits a lot of default values from the
# 'generic-contact' template which is defined elsewhere.

define contact{
    contact_name      nagiosadmin
    alias              Admin Alerte Nagios
    email              admin@stadiumcompany.com
    service_notification_period 24x7
    service_notification_options w,u,c,r,f,s
    service_notification_commands notify-service-by-email
    host_notification_period 24x7
    host_notification_options d,u,r,f,s
    host_notification_commands notify-host-by-email
}
```

- **Application** : `service nagios restart`.
- Puis on réaccède à l'interface Nagios, on remarque que le **PID** change

Conclusion

La mise en place de ce serveur Nagios Core à l'adresse **172.20.1.9** constitue une étape majeure dans la sécurisation et la maîtrise de l'infrastructure réseau. À travers ce projet, nous avons non seulement appris à compiler et installer une solution complexe à partir des sources, mais aussi à configurer finement les interactions entre les différents systèmes (Windows et Linux) et les protocoles de communication (SMTP pour les alertes). La force de Nagios réside dans sa modularité, permettant d'étendre la surveillance à n'importe quel équipement réseau futur. Grâce aux notifications configurées, l'administrateur est désormais alerté instantanément de toute anomalie, réduisant ainsi considérablement le temps moyen de réparation (MTTR). Ce compte rendu démontre une solution de supervision robuste, prête à être exploitée dans un environnement de production réel pour assurer la continuité de service.
